

EKS 42/EKS 50

Transponder

ISO-Card

KeyTag

BlueTag

StrongTag

Transponders with key function are available in four variants:

- ISO-Card "KeyCard"
- key ring pendant "KeyTag"
- key ring pendant "BlueTag"
- key ring pendant "StrongTag"

All four variants have identical functions.

Every transponder (electronic key) is a unique specimen with a non-recurring and unchangeable identifier.

Particular transponders can be deleted from the memory of the EKS. Additional transponders can be stored into the EKS on site.

The EKS can memorize up to 156 different transponder identifiers.

Option:

On request, key transponders are also available with identical identifiers. This identifier will be memorized in the EKS only once. Any quantity of transponders with identical identifier can operate the EKS.

Thus, particular transponders cannot be deleted from the memory of the EKS (e.g. if they got lost). Additional transponders can operate the EKS without any storage work.

Remark:

Key transponders with identical identifier are only available as "BlueTag".

As a rule, the EKS is being delivered ready for installation, i. e. the enclosed transponders are stored in the memory of the EKS and the desired configuration is set.

By means of the optionally available special function cards

- ProgrammingCard
- ResetCard
- DeleteCard

the configuration of the EKS can be modified.

Customized designs available on request.
